

Deep Profile Swing

Indicators & Analysis / Deep Indicators | advanced | 5 min read | DeepCharts Help Center | August 24, 2026

Deep Profile Swing automatically plots a volume profile on each price swing, based on custom parameters you set. Instead of profiling a fixed period like a day or week, it profiles the moves themselves — every impulse and retracement gets its own volume distribution.

That makes it a structural tool: it shows you how volume was distributed inside a leg of the move, where the swing's VWAP sits, and which levels created during the swing may act as supply or demand later — including around Break of Structure (BOS) points.

What it is

The indicator detects swings using one of four methods (bar-count, new extremes, absolute reversal or tick reversal), then builds a profile — volume, ask/bid, delta, delta plus volume, or delta percentage — over each detected swing. It can also compute a VWAP per swing. Separate, independent stop criteria control when a swing is considered terminated.

If profile anatomy is new to you, explore the live histogram below first — hover the rows and note the POC and value area, the same structures every swing profile carries.

[WIDGET: volume-profile-lab]

When to use it

- You trade market structure and want to see the volume that built each leg, not only the leg's shape.
- You look for supply/demand zones anchored to actual swing activity rather than arbitrary time windows.
- You want a swing-anchored VWAP that starts fresh with each new move.
- You analyze whether a breakout leg was supported by real participation (a full, well-distributed profile) or was thin (a hollow, low-volume leg).

Quick start

1. Open a chart and add **Deep Profile Swing** from the chart's **Indicators** button.
2. In the **Main Swing Settings**, pick a **Swing Type** — **Reversal Tick** is a practical start for intraday futures: a swing ends after price moves a set number of ticks against the current direction.
3. Set the reversal threshold (**Tick Rev.**) large enough that ordinary noise does not end a swing.
4. In **General settings**, set **VBP Type** to **Volume** and **Display Mode** to **Profile And Lines**.
5. Apply — each detected swing now carries its own profile.

If the chart gets crowded, switch **Display Mode** to **Lines Only** — you keep the key levels and lose the histograms.

How to read it

- **Each profile = one swing.** The histogram shows where volume concentrated within that leg. A fat node mid-swing marks a battle zone; volume thinning into the swing's end suggests the move ran out of participants.
- **Swing highs/lows with heavy adjacent volume** often become supply or demand references on the next visit.

- **Swing VWAP** (Length Type = VWAP): the volume-weighted average price of the move itself. Price holding above a rising swing VWAP keeps the leg constructive; a confirmed break (see **VWAP Break Ticks**) ends the plot by design.
- **Delta and Delta Percentage types** reveal whether the swing was driven by aggressive buyers or sellers — a rally whose swing profile shows weak or negative delta was lifted on thin aggression and deserves suspicion.

Settings reference

Grouped as in the indicator dialog.

General settings

Setting	What it does
VBP Type	Profile analysis method: Volume (total volume per level — the most active prices of the swing), Ask Bid Volume (separate ask and bid volume to assess buyer/seller balance), Delta (buy minus sell volume — direction of pressure), Delta and Total Volumes (both combined), Delta Percentage (delta as a percentage of total volume — relative strength of the pressure)
Length Type	Calculation basis: Swing (a volume profile per swing movement) or VWAP (volume-weighted average price within the swing)
Include Reversal Bar	Includes or excludes the reversal bar that marks a new swing's start from the profile
Display Mode	Profile And Lines (histogram plus key level lines) or Lines Only (key level lines only — clean charts)

Main Swing Settings

Setting	What it does
Swing Type	Detection method: Left Right Bar (a swing is an extremum with a defined bar count on each side), Highest Lowest (new highs/lows relative to previous movement), Reversal Absolute (a fixed price movement against the trend triggers the reversal), Reversal Tick (a defined tick count against the trend — suited to short-term trading)
Abs. Rev.	Minimum price movement required for a reversal when using Reversal Absolute
Tick Rev./Highest Lowest	Tick quantity needed for reversal detection or for new high/low identification
Right Bar	With Left Right Bar : how many bars to the right must form before a swing is validated

Swing Stop Settings

These parameters mirror the Main Swing Settings but operate independently, so the criteria that end a swing can differ from the criteria that detect one.

Setting	What it does
Enable Stop Swing	Toggles the separate swing-termination criteria on or off

VWAP Swing Settings

Applied when **Length Type** = **VWAP**:

Setting	What it does
Swing Min Ticks	Minimum ticks required to initiate a swing — filters out small movements
Swing Max Ticks	Maximum ticks before the current swing closes and a new one starts — prevents one enormous move being treated as a single swing
VWAP Break Ticks	Ticks needed to confirm a VWAP break within the swing; once exceeded, the current swing VWAP stops plotting

Tips and common mistakes

- **Profiles appear on every wiggle?** Detection is too sensitive. Raise **Abs. Rev.**, **Tick Rev.** or **Right Bar** (whichever your Swing Type uses), and consider enabling the Stop Swing rules.
- **You want levels, not histograms: Display Mode = Lines Only.**
- **Swing VWAP line stops mid-move:** either **VWAP Break Ticks** was reached (a confirmed break stops the plot) or **Swing Max Ticks** was hit (the swing closed and a new one began). Both are by design, not a bug.
- **Detection method choice matters more than styling.** Left Right Bar confirms late but is stable; tick/absolute reversal reacts faster but flips more often in chop. Match it to your timeframe before tuning anything else.
- Different **Input Data**-style choices in the profile family change shapes — if this swing profile disagrees with your Deep Profile (Volume / Delta Profile), compare configurations first.
