

Supported Brokers, Prop Firms and Data Feeds

Connections & Data Feeds / Setup | beginner | 7 min read | DeepCharts Help Center | July 20, 2026

DeepCharts connects to live market data through a small set of feed technologies — Rithmic, dxFeed, CQG and the Interactive Brokers TWS API — but dozens of brokers and prop firms issue accounts on top of those technologies. This page is the master list: who is supported, which **Feed Source** to pick, and which **Server** value belongs to each provider.

If your provider is listed here, the connection takes a few minutes in Feed Settings. If it is in the unsupported table at the bottom, DeepCharts cannot connect to it directly — but you can still chart on a supported feed and execute trades on the provider's own platform.

What it is

A compatibility matrix. It answers three questions before you touch any settings: "Can my account connect to DeepCharts at all?", "Which Feed Source do I select?", and "What exactly goes in the Server field?" Wrong answers to the last two are the most common causes of a connection that stays red, so treat the tables below as the reference of record.

When to use it

- You are choosing a broker or prop firm and want to know it will work with DeepCharts before you pay.
- You already have an account and need the exact **Feed Source** and **Server** values for Feed Settings.
- Your connection dot stays red and you suspect a wrong Server value — see Fix: Connection Failed — Bad Server.
- Someone told you a platform "works with everything" and you want to check before buying.

Quick start

1. Find your provider in the tables under Settings reference below.
2. Note its **Feed Source** value and, where one exists, its **Server** value.
3. Sign the market data agreement for that account type — see Sign Your Market Data Agreement.
4. Enter the values in **Select Connection** → **Feed Settings** — see How to Connect a Data Feed (Feed Settings).
5. Route your exchanges to the new feed in **Options** → **Symbol Manage** — see Symbol Manage: Subscribe Exchanges and Map Your Feed.

Try the live Feed Settings mock below — open the Feed Source dropdown and watch the fields change for each source.

[WIDGET: feed-navigator]

How to read it

- **Feed Source** is the dropdown value in Feed Settings. Note that Rithmic appears as **Rithmic RAPI** and **Rithmic Wss - beta** — there is no plain "Rithmic" entry. Pick **Rithmic RAPI**; it is the recommended source.
- **Server** is a separate field that only appears for some sources. It must match the table exactly. When Feed Source is **dxFeed Prop**, no Server field appears at all — do not look for one.
- **Agreement** tells you where the market data agreement is signed for that account type. Every live feed requires one before it will connect; see Sign Your Market Data Agreement.

Settings reference

Prop firms — Rithmic accounts

All Rithmic prop-firm accounts use **Feed Source = Rithmic RAPI**. Evaluation and Funded accounts connect the same way. The agreement is signed inside R Trader Pro for every Rithmic account.

Prop firm	Server value
Apex Trader Funding	Apex
4PropTrader	4PropTrader
10X Futures	10XFutures
Bulenox	Bulenox
DayTraders.com	DayTraders.com
Earn2Trade	Earn2Trade
FundedFuturesNetwork	FundedFuturesNetwork
Legends Trading	LegendsTrading
Lucid Trading	LucidTrading
MES Capital	MES Capital
PropShopTrader	PropShopTrader
The Trading Pit	TheTradingPit
Thrive Trading	ThriveTrading
TradeFundrr	TradeFundrr
Tradeify	Tradeify [CONFIRM: exact Tradeify server spelling in the dropdown]
tradesea	tradesea (lowercase in the dropdown)
TakeProfitTrader	Rithmic Paper Trading
OneUpTrader	Rithmic Paper Trading

Note: If your Rithmic prop firm is not in this table and its name does not appear in the Server dropdown, select **Rithmic Paper Trading** — that is Rithmic's default server for data-feed-only and smaller prop accounts. The same value is used in R Trader Pro. See [Connect Any Rithmic Prop-Firm Account \(Server Table\)](#) for the full walkthrough, or [Connect Apex Trader Funding](#) for the Apex-specific guide.

Prop firms — dxFeed accounts

These firms issue dxFeed credentials. Use **Feed Source = dxFeed Prop** — this source has no Server field. The agreement is signed on the prop firm's own dashboard (or via their email link), never in R Trader Pro. Full walkthrough: [Connect a Prop-Firm dxFeed Account \(MFF, Aqua, Goat...\)](#).

Prop firm	Notes
Aqua Futures	Bundles a DeepCharts platform license
MyFundedFutures (MFF)	Bundles a DeepCharts platform license
Phidias	Issues dxFeed (not Rithmic, despite some older documentation)
YRM Prop	Bundles a DeepCharts platform license
BlueSky Trading	Offers both dxFeed and Rithmic accounts — check which you bought; the Rithmic variant uses Server = Rithmic Paper Trading
SoloClashes	—
Goat Funded Futures	Offers both CQG and dxFeed — only the dxFeed account works with DeepCharts

Note: At checkout these firms ask you to pick a trading platform. Picking DeepCharts or DeepDom produces the same working dxFeed credentials — either choice connects. Only an unrelated platform choice (Tradovate, NinjaTrader, Quantower and similar) breaks compatibility; in that case ask the firm's support to switch your platform selection so they can re-issue credentials.

Futures brokers

Broker	Account types	Rithmic Server value
AMP Futures	CQG or Rithmic	Rithmic 01
EdgeClear	CQG or Rithmic	Rithmic 01
Ironbeam	CQG or Rithmic	Rithmic 01
Phillips Capital	CQG or Rithmic	Rithmic 01
Optimus Futures	CQG or Rithmic	Rithmic 01
Interactive Brokers (IBKR)	TWS API — execution only	—

CQG broker accounts use **Feed Source = CQG**; see How to Connect CQG (AMP, Optimus, EdgeClear, Ironbeam...). CQG accounts work in exactly two cases: issued by one of these brokers, or issued by a prop firm directly from CQG. A CQG account that comes through Tradovate or NinjaTrader cannot be connected.

IBKR returns aggregated data, so it is useful for trade execution only — you must pair it with a real data feed (Rithmic or dxFeed) and route your charts to that feed in Symbol Manage. See Connect Interactive Brokers (Execution Only).

Direct data feeds (no broker or prop firm)

Where you bought it	Feed Source	Server	Agreement signed
dxFeed from the DeepCharts website	dxFeed	Website Account	DeepCharts dashboard — Sign Market Data Contract
Rithmic from the DeepCharts website	Rithmic RAPI	Rithmic Paper Trading	Inside R Trader Pro
dxFeed from dxfeed.com	dxFeed	dxFeed Account	On the dxFeed site
Rithmic issued via another platform (Quantower, Sierra Chart, MotiveWave, ATAS, NinjaTrader...)	Rithmic RAPI	Rithmic Paper Trading	Inside R Trader Pro
Free 15-minute delayed feed (built in)	15 min delayed	—	None required
DeepCharts Competition account	V-Sim	—	See DeepCharts Competition: Join and Connect

Warning: dxFeed credentials issued through other charting platforms cannot be used with DeepCharts — only Rithmic credentials carry across that way. And when buying on dxfeed.com you must select DeepCharts as your platform at purchase, or the credentials will not be compatible.

Note: Rithmic does not sell data feeds from rithmic.com. If you believe you bought "Rithmic from Rithmic", the account actually came from a broker, a prop firm, a third-party platform or the DeepCharts website — find that row above.

Market depth by feed

Depth capability matters if you trade with the DOM or orderflow indicators.

Feed	Level 2 depth
dxFeed (CME Group exchanges)	MBO — a DOM Type field lets you choose MBO or the lighter MBP

Feed	Level 2 depth
Rithmic (CME Group exchanges)	Always MBO — no MBO/MBP choice
dxFeed (stocks and non-CME exchanges such as Eurex)	Not MBO
CQG	Not MBO; full depth for ES but not full depth for NQ

Not supported

These providers do not issue credentials DeepCharts can use. The workaround is the same for all of them: connect any supported feed (the free 15-minute delayed feed works for a start — see [Use the Free 15-Minute Delayed Data Feed](#)), analyze on DeepCharts, and place your trades manually on the provider's own platform.

Provider	Type
TopStep	Prop firm
Tradovate	Broker
TradeStation	Broker
Charles Schwab	Broker
Tastytrade	Broker
FundedNext Futures	Prop firm
FTMO	CFD prop firm
FP Markets	CFD broker
IC Markets	CFD broker
HankoTrade	CFD broker
Vantage Markets	CFD broker

Tips and common mistakes

- **The Server value is exact.** "Apex" is not "Paper Trading", and a firm's dedicated entry is not interchangeable with the fallback. A wrong Server is the second most common cause of a red connection dot after wrong credentials — see [Fix: Connection Failed — Bad Server](#).
- **CQG must come directly from CQG.** Broker-issued CQG (AMP, EdgeClear, Ironbeam, Phillips Capital, Optimus) and prop-firm CQG issued directly by CQG both work. CQG via Tradovate or NinjaTrader never does. The same split applies to NinjaTrader accounts: NinjaTrader Rithmic credentials connect (Server = Rithmic Paper Trading); NinjaTrader CQG credentials do not.
- **Feed credentials are not website logins.** Prop firms and brokers issue separate Rithmic or dxFeed credentials, usually in a welcome email. Entering your firm's dashboard login is the number one cause of connection failures — see [Fix: Connection Failed — Check Username and Password](#).
- **Bulenox is spelled Bulenox** — users often type "Bluenox" and then fail to find the server entry.
- **You can save several connections** and switch between them from the main-bar feed selector — see [Manage and Switch Between Feed Connections](#).
