

Deep Wall

Indicators & Analysis / Deep Indicators | advanced | 3 min read | DeepCharts Help Center | July 20, 2026

Deep Wall is a specialized indicator developed by the DeepCharts team specifically for ES charts. It monitors price behavior at key levels and flags moments when a wall of passive orders absorbs incoming aggressive orders and triggers a price rejection — the classic signature of a hidden iceberg order.

It is deliberately a low-frequency tool. Signals appear only a few times per week or even per month, mostly in low-liquidity environments such as the London session. If it has been quiet for days, that is normal behavior, not a malfunction.

A wall is simply outsized passive liquidity resting in the order book. Hover the live ladder below to see how sell limits stack above price and buy limits below — the resting orders a wall is made of.

[WIDGET: dom-ladder]

What it is

Deep Wall answers one question: "did a large passive player defend this price?" When aggressive orders repeatedly hit a level and the resting liquidity there keeps absorbing them until price rejects, Deep Wall marks the event. Because that pattern typically comes from iceberg orders — large orders shown to the market in small slices — the signal points at hidden institutional liquidity.

Warning: Deep Wall is built for **ES** charts specifically. Applying it to other instruments will not give meaningful signals.

When to use it

- You trade ES and want alerts for hidden iceberg activity without watching the DOM all session.
- You look for high-probability rejection/reversal spots backed by real passive absorption.
- You trade low-liquidity windows (for example the London session) where wall behavior is most visible.
- You want an independent confirmation layer on top of tools like Deep Trades or the DOM.

Quick start

1. Open an **ES** chart.
2. Open the **Indicator List**, locate **Deep Wall** and click **+** to add it.
3. Click the **Settings** icon next to Deep Wall.
4. Set up an alert so you do not miss the rare detections: go to **Options** → **Settings** → **Add Alert** and configure the **Alert Sound** and **Message Popup** for Deep Wall events.

How to read it

A Deep Wall detection means aggressive flow ran into passive liquidity that refused to break — absorption followed by rejection. Treat the marked level as defended:

- **Rejection trades:** the detection itself argues for a move away from the wall; many traders use it as a reversal or fade location.
- **Level memory:** a level a large player defended once often matters again on a retest.

- **Failure is information too:** if price later breaks cleanly through a detected wall, the defender is gone — that break carries its own signal.

Because signals are rare, each one carries weight. Do not dilute the tool by expecting several per session.

Settings reference

Deep Wall's detection logic is preconfigured; the user-facing settings center on notifications.

Setting	What it does
Alert Sound	Plays a sound when a Deep Wall event triggers. Configure via Options → Settings → Add Alert .
Message Popup	Shows a popup message on detection so the event is not missed.

Tips and common mistakes

- **"It never triggers" is usually normal.** A few signals per week or month is the design. Patience is part of the tool.
- **Check the symbol first.** If you see nothing for a long time, confirm the indicator is applied to an ES chart — it is ES-specific.
- **Always configure the alert.** With signals this infrequent, an unwatched chart means missed detections.
- **Confirm with context.** Combine a detection with orderflow context — the tape, Deep Stats absorption reads, or footprint structure in Deep Print (Footprint) — before committing to a trade.
