

# Re-download Historical Data (Download Data Tool)

Data & Database | intermediate | 10 min to complete | DeepCharts Help Center | July 20, 2026

The **Download Data** tool pulls historical data for a symbol into your local database on demand. You will use it most often as the second half of the corrupt-data repair loop — first delete the bad data with Delete Market Data (In-App and Manual Methods), then re-download a clean copy — but it is equally useful for pre-loading history before a replay session or filling in bars for a symbol you have not charted in a while. By the end of this guide you will have downloaded fresh historical data for a symbol and confirmed it arrived.

## Before you start

- Your data feed is configured and working.
- The symbol is subscribed in Symbol Manage.
- You have deleted the corrupted range first — only needed if you are repairing bad data rather than simply backfilling.

## Steps

1. Go to **Options** → **Download data**.

[ SCREENSHOT PLACEHOLDER ] The Options menu open on the main DeepCharts bar with the Download data entry highlighted `options-menu-download-data.png`

2. Select the symbol or symbols you want to download.
3. Set the **start date** — how far back the download should reach. For a corruption repair, start at least as far back as the range you deleted; for replay preparation, cover the full session range you plan to replay.
4. Set the **Data Type**. **Tick** is the most granular option and is what orderflow tools such as footprints and profiles are built from. **[CONFIRM: full list of Data Type options in the Download data window and the default selection]**
5. Decide whether to enable the **Download From VolServer** toggle. **[CONFIRM: exact behavior of the Download From VolServer toggle — what source is used when it is on versus off, and the recommended setting for a standard repair]**

[ SCREENSHOT PLACEHOLDER ] The Download data window with a symbol selected, a start date set, Data Type set to Tick, and the Download From VolServer toggle visible `download-data-window-configured.png`

6. Start the download and leave the window to work. Large tick-data ranges can take a while, so avoid downloading months of tick history mid-session if you only need a few days. **[CONFIRM: exact label of the button that starts the download]**
7. To watch progress, open **Options** → **Show Logs** and check the **Connection Logs** tab — it shows chart-data download progress as it runs.

## If you are repairing corrupted data

Run the full repair loop in this order:

1. Delete the corrupted range with Delete Market Data (In-App and Manual Methods) (in-app method first).
2. Re-download the same range with this tool.
3. Reopen the chart and confirm the bad bars are gone.

### ***If you are pre-loading data for replay***

Download the sessions you plan to replay before you start, then follow [Replay Market Data](#). The **Connection Logs** tab is the easiest way to confirm the replay data has finished loading.

### **Verify it worked**

1. Open a chart for the symbol and scroll back through the downloaded range.
2. Historical bars should be present and continuous across the range you requested.
3. The **Connection Logs** tab in **Options** → **Show Logs** should show the download activity completing without errors.

### **If something went wrong**

| Symptom                                     | What to do                                                                                                                                                                       |
