

Fix: Gaps in Price on Charts

Connections & Data Feeds / Troubleshooting | intermediate | 10 min to complete | DeepCharts Help Center | August 24, 2026

Gaps in your price history have three possible origins: corrupted data in the local database, legitimate market gaps, or an expired or invalid futures contract month. Only the first one is a problem you can fix by re-downloading data — so before deleting anything, take a minute to rule out the other two.

Symptom

- A chart shows a gap: missing candles or a hole in the price history where data should be.
- The gap persists after scrolling away and back, or reappears on new charts of the same symbol.

Not to be confused with Fix: Live Feed Connected but Chart Is Not Moving — there the chart stops updating entirely; here history is loaded but has holes in it.

Most likely cause

Corrupted historical data for that symbol in DeepCharts' local database — the chart faithfully renders the broken data it finds on disk.

Quick fix

Before deleting anything, check the two cases that are not data corruption:

1. Look at the timestamps around the gap. If it sits at a session break, over a weekend, or in a low-liquidity period, it is a real market gap — normal trading behavior that cannot and should not be "fixed". See Understanding Market Structure and Sessions (RTH/ETH, Rollover).
2. For futures, confirm the chart is on the correct, active contract expiry month before assuming a data problem. An expired or invalid contract produces thin, gap-filled history — see Symbol Rollover (Change Contract Month).

If neither applies, delete the affected symbol's stored data so DeepCharts re-downloads it:

3. Use the in-app delete tool (**Options** → **Delete data**): pick the affected symbol and a date range covering the gap. This removes only that slice of data — the full walkthrough is in Delete Market Data (In-App and Manual Methods).
4. Restart DeepCharts and open the chart again. The software automatically downloads fresh data for the deleted range.

If that didn't work

Cause: Deeper corruption in the symbol's database folder

If the gap survives an in-app delete, remove the symbol's entire data folder manually:

1. Open **General Settings** and locate the **Database Folder Path**.

[SCREENSHOT PLACEHOLDER] General Settings dialog with the Database Folder Path field highlighted `dc-en-gaps-in-price-03.png`

2. Navigate to that folder in File Explorer.

3. Delete only the affected symbol's folder.

Warning: Always delete only the affected symbol's folder — never the entire database. Deleting everything wipes the stored history for all symbols.

[SCREENSHOT PLACEHOLDER] File Explorer inside the database folder with a single symbol's subfolder selected for deletion, other symbol folders visible untouched  dc-en-gaps-in-price-04.png

4. Restart DeepCharts. It automatically downloads fresh data for that symbol.

Cause: The gap is real market activity

Session breaks, weekend gaps and low-liquidity periods leave genuine holes in price. These reflect actual trading activity, so no amount of re-downloading will fill them.

Cause: Expired or invalid contract month

If the symbol still points at an old futures contract, roll it to the active month — see Symbol Rollover (Change Contract Month) — then reload the chart.

Still stuck

If gaps keep reappearing across symbols, the database itself may need attention — see Fix: Database Problems. Otherwise generate a Diagnostic Report: Before You Contact Support and contact support via How to Get Help (Chat, Diagnostic Report, Support).

Prevent this

- Keep contracts current with Symbol Rollover (Change Contract Month) so charts never load a dead contract month.
- Run Database Optimization periodically to keep the local database healthy.
