

VWAP + Envelopes

Indicators | intermediate | 5 min read | DeepDOM Help Center | August 24, 2026

The VWAP (Volume Weighted Average Price) indicator displays the average price of trades weighted by volume over a chosen time period along with standard deviation bands above and below it

What is the VWAP? Think of the VWAP as the "true average price" of the market — but smarter than a regular average. Instead of treating every trade equally, it gives more weight to price levels where more volume was traded. This makes it a much more accurate representation of where the market has been doing most of its business. Traders use it as a benchmark for fair value — if price is above the VWAP, it is trading at a premium; if it is below, it is trading at a discount.

Standard deviation bands measure how far price is moving away from the average. They help traders identify Premium and Discount zones — areas where price is trading above or below fair value — and can be used to make more informed entry and exit decisions.

Here is what each band represents:

First Standard Deviation (+1 / -1) — the main volatility range; where price spends most of its time. This is considered the "normal" zone around fair value

Second Standard Deviation (+2 / -2) — signals greater volatility and potential significant price moves. Price reaching here is less common and may indicate an overextended move

Third Standard Deviation (+3 / -3) — represents rare, extreme price movements. Price at this level is statistically unusual and may signal a strong potential for a pullback toward the VWAP

How to Add the VWAP to Your Chart

There are two ways to add the VWAP indicator:

Right click on the chart -> Indicators

Search for the VWAP Envelopes indicator and click on the "+" symbol

Open the settings panel to customize settings -> Save

Once added, click the settings icon on the indicator to open its configuration window.

General Settings

Period Mode Defines the time period used to calculate the VWAP. You can choose between:

Day — calculates the VWAP from the start of the current trading day, resetting at the open of each new session

Minutes — calculates the VWAP over a set number of minutes, giving you a shorter-term view of fair value

Seconds — calculates the VWAP over a set number of seconds, useful for very short-term analysis

Orders — calculates the VWAP based on a set number of orders rather than a time period

Period Value Sets the numeric value for the period chosen above. For example, if you selected Minutes, you would enter 30 here for a 30-minute VWAP.

Envelope Mode Defines how the bands are calculated. You can choose between:

Standard Deviation — bands are based on statistical deviation from the VWAP, automatically adjusting to market volatility

Percentage — bands are based on a fixed percentage change from the VWAP price, staying consistent regardless of volatility

Display Settings

Line Color Sets the color of the VWAP line on the chart.

Line Width Sets how thick the VWAP line appears.

Envelope Width Sets the thickness of the standard deviation bands.

Envelope Style Sets the line style of the bands — for example solid, dashed, or dotted.

Band Settings — First, Second & Third Band

Each of the three bands can be individually configured:

Enable or disable each band independently

[SCREENSHOT PLACEHOLDER] VWAP + Envelopes — Band Settings — First, Second & Third Band (DeepDOM)
dd-en-vwap-envelopes-deepdom-05.png

Set the standard deviation value for each band

[SCREENSHOT PLACEHOLDER] VWAP + Envelopes — Band Settings — First, Second & Third Band (DeepDOM)
dd-en-vwap-envelopes-deepdom-06.png

Choose a custom color for each band

dd-en-vwap-envelopes-deepdom-07.png

This allows you to show only the bands that are relevant to your trading style — for example, enabling just the first and second bands while leaving the third off. Keeping fewer bands active can make the chart easier to read, especially in fast-moving markets.

Using Multiple VWAPs

You can apply more than one VWAP indicator to the same chart at the same time. A common example is combining a Daily VWAP with a shorter-period VWAP to get both a macro and a micro view of fair value.

For example — a daily VWAP in yellow and a 30-minute VWAP in cyan applied to the same chart. The daily VWAP shows you the bigger picture of where fair value is for the whole session, while the 30-minute VWAP shows you where fair value is right now within that session.

Conclusion

The VWAP indicator is one of the most widely used tools in order flow trading. By combining the VWAP line with its standard deviation bands, you can quickly identify whether price is trading at fair value, in a premium, or in a discount — giving you a structured framework for your entries and exits.
