

Fix: Database Problems

Data & Database | intermediate | 15 min to complete | DeepCharts Help Center | August 24, 2026

DeepCharts keeps all downloaded market history in a local database. When part of it becomes corrupted, charts start behaving in ways that look like feed problems but are not: wrong or garbled prices, gaps, charts that hang while loading. This article walks through the database-side fixes, from the least destructive to the most.

Symptom

One or more of the following, while your data feed itself connects normally:

- Charts show incorrect, garbled, or stale prices.
- Charts hang or take very long while loading history.
- Gaps appear in price history that your broker's chart does not show.
- Errors mentioning the database or data files appear when opening charts.

Not to be confused with:

- A feed that will not connect at all — see Fix: Connection Failed — Unable to Establish Connection.
- A connected feed with a chart that simply is not ticking — see Fix: Live Feed Connected but Chart Is Not Moving first.
- A "Could not find a part of the path" error — see Fix: Could Not Find a Part of the Path.

Most likely cause

Corrupted locally stored history for one or more symbols — the database itself is fine, but a stretch of a symbol's data is bad and needs to be deleted and re-downloaded.

Quick fix

Delete the corrupted range in-app and let DeepCharts re-download it:

1. Disconnect the data feed and close all workspaces.
2. Go to **Options** → **Delete Data**.
3. In the **Delete Data** panel, set the date to a point before the error appeared — 15 days or more back is recommended.
4. Select the **Tick and Minute** data types.
5. Choose the symbol (or symbols) with the corrupted history.

6. Click **Delete** and wait for it to finish.
7. Close the platform, wait 30 seconds, then restart DeepCharts.
8. Reconnect and open the chart — fresh data downloads automatically.

For the full walkthrough of this procedure (including the manual fallback), see Delete Market Data (In-App and Manual Methods).

If that didn't work

Cause: The whole database is corrupted

If problems affect many symbols or persist after targeted deletes, remove the entire database folder so DeepCharts rebuilds it from scratch:

1. Go to **Options** → **Settings** → **Various** and copy the **Database Folder** path.

[SCREENSHOT PLACEHOLDER] The Settings dialog on the Various tab with the Database Folder path highlighted

2. Disconnect the data feed, close all workspaces, and exit DeepCharts completely.
3. Open Windows Explorer and paste the copied path into the address bar.
4. Delete the **Database** folder.
5. Restart DeepCharts.

Warning: This deletes ALL downloaded market history for every symbol. DeepCharts re-downloads data as you open charts, but re-building deep tick history takes time. Use this only after the targeted delete has failed. Your account credentials and subscriptions are not affected.

Cause: Missing market subscription (no realtime or unavailable data)

If the problem is missing live data rather than corrupt history, check the symbol-to-feed mapping:

1. Connect the data feed and close all workspaces.
2. Go to **Options** → **Symbol Manage**.
3. Verify the correct markets are added and associated with the right data feed connection profile.
4. If a market is mapped to the wrong feed, right-click the data feed column to re-associate it.
5. Click **Select** to save the changes.
6. Reconnect the data feed and open a new chart.

You can rehearse the mapping fix in the mock below — click the chain-link icon to cycle which feed a market is mapped to.

[WIDGET: symbol-manage-mock]

See Symbol Manage: Subscribe Exchanges and Map Your Feed for the full window reference, and Fix: Symbol Subscription Issue if a subscription error is shown.

Cause: Missing Visual C++ runtime (data feed connection failed)

If the database checks pass but the data feed connection itself keeps failing, a missing system runtime can be the culprit:

1. Close DeepCharts completely.
2. Download and install Visual C++ (the Microsoft Visual C++ Redistributable).
3. Restart DeepCharts and reconnect the data feed.

Still stuck

Generate a Diagnostic Report: Before You Contact Support so support can see your logs and configuration, then reach out through the channels in How to Get Help (Chat, Diagnostic Report, Support).

Prevent this

- Run Migrate / Compress regularly — a compact database is less prone to problems and much faster.
- Use the in-app Delete Data tool instead of deleting files manually, and always restart DeepCharts after any manual file-level maintenance.
- Never shut the computer down while the platform is writing data or compressing the database.
