

# Fix: App Crashes When Saving Feed Settings

Connections & Data Feeds / Troubleshooting | beginner | 15 min to complete | DeepCharts Help Center | July 16, 2026

You fill in your feed details, click **Save** in **Feed Settings** — and DeepCharts crashes. There are three known causes: missing administrator permissions, a non-English Windows system language, and corrupted configuration files. Work through them in that order; each fix is more involved than the last.

## Symptom

- DeepCharts crashes (closes unexpectedly) the moment you click **Save** in **Feed Settings**.
- The crash may happen every time or only when saving a specific connection.

The exact cause is usually visible in the latest application log file — look for the most recently created file following the `DPC_Log_Date.txt` naming pattern. **[CONFIRM: exact folder where DPC\_Log files are stored]**

This is the window where the crash happens — the interactive mock below shows the same Feed Settings fields you were filling in before clicking **Save**.

[WIDGET: feed-navigator]

## Most likely cause

DeepCharts needs permission to read and write its configuration files (such as `config.settings`) when saving a feed. Without administrator privileges, the save can crash the application.

## Quick fix

Run DeepCharts as administrator:

1. Close DeepCharts completely.
2. Locate `DeepChart.exe` on your system.
3. Right-click it and select **Run as administrator**.

[ SCREENSHOT PLACEHOLDER ] Windows Explorer context menu on `DeepChart.exe` with "Run as administrator" highlighted `run-deepcharts-as-administrator.png`

4. Open **Feed Settings** again and click **Save**.

**Tip:** Running DeepCharts as administrator is recommended in general, particularly during initial setup, so the app can always write its configuration files.

## If that didn't work

### **Cause: Windows system language is not English**

A non-English Windows system language can prevent DeepCharts from correctly reading or writing configuration values during the save.

1. Change the Windows display and system language to **English** (Windows Settings → Time & Language → Language).
2. Restart your PC.
3. Launch DeepCharts and try saving the feed settings again.

### **Cause: Corrupted configuration files**

If `config.settings` or `connProp.settings` are corrupted, the app crashes whenever it tries to save or update them. The fix is to remove the stored configuration so DeepCharts recreates it.

**Warning:** Deleting the AppData folder resets your local settings. You will need to re-configure your data feed afterward — keep your credentials at hand and see [How to Connect a Data Feed \(Feed Settings\)](#).

1. Open File Explorer and go to **Local Disk (C:) → Users → [your user folder]**.
2. Enable hidden files: **View → Show → Hidden items**.

[ SCREENSHOT PLACEHOLDER ] File Explorer View menu open with Show > Hidden items checked, in the user profile folder  file-explorer-show-hidden-items.png

3. Open the **AppData** location and delete the DeepCharts application folder. **[CONFIRM: exact AppData subpath (Local or Roaming) and exact folder name]**

[ SCREENSHOT PLACEHOLDER ] AppData folder in File Explorer with the DeepCharts application folder selected before deletion  appdata-deepcharts-folder.png

4. Relaunch DeepCharts as administrator and configure your feed settings again.

**Note:** Avoid force-closing the application while settings are being saved — an interrupted write is one way these files get corrupted in the first place.

## Still stuck

Review the latest `DPC_Log_Date.txt` file for detailed crash information — if you cannot interpret it, generate a Diagnostic Report: Before You Contact Support and contact support through [How to Get Help \(Chat, Diagnostic Report, Support\)](#), attaching the log.

## Prevent this

- Run DeepCharts as administrator, especially during initial setup.
- Never force-close the app while it is saving settings.
- Follow [How to Connect a Data Feed \(Feed Settings\)](#) when configuring feeds so every field is saved in one pass.
