

Manage and Switch Between Feed Connections

Connections & Data Feeds / Setup | intermediate | 10 min to complete | DeepCharts Help Center | August 24, 2026

By the end you will be able to keep several feed connections saved in DeepCharts, switch between them, run more than one at the same time, auto-connect your main feed on startup and remove connections you no longer need.

DeepCharts stores every connection you create in **Feed Settings** as a separate saved profile. All of them appear in the main-bar feed selector, and the status dot next to each one tells you its connection state at a glance. The key thing to keep in mind throughout: which feed a chart actually uses is decided by **Symbol Manage** routing, not by which feed you connected most recently.

Before you start

- At least one working feed connection — [How to Connect a Data Feed \(Feed Settings\)](#)
- If you plan to combine feeds, check what each one is good for — [Supported Brokers, Prop Firms and Data Feeds](#)

Steps

Read the feed selector

1. Look at the **Select Connection** control in the main bar. It shows your connections and a status dot for each — green means connected.

[SCREENSHOT PLACEHOLDER] DeepCharts main bar with the Select Connection dropdown open, listing several saved connections, one with a green dot and the others disconnected [feed-selector-multiple-connections.png](#)

Note: A yellow dot on a Rithmic connection that uses the R Trader plugin means DeepCharts is waiting for R Trader — see [Connect Rithmic Using the RTrader Pro Plugin](#).

Add another connection

2. Click **Select Connection** → **Feed Settings**.
3. Click **Add Connection**, fill in the form for the new feed source and click **Save**. Each source has its own required fields — try it in the interactive Feed Settings mock below: switch the Feed Source and watch the fields change, then follow the matching guide ([How to Connect a Rithmic Data Feed](#), [How to Connect a dxFeed Data Feed](#), [How to Connect CQG \(AMP, Optimus, EdgeClear, Ironbeam...\)](#), [Connect Interactive Brokers \(Execution Only\)](#), [DeepCharts Competition: Join and Connect](#), [Connect Historical Data \(End of Day\)](#)).

[WIDGET: feed-navigator]

Some feed sources expose extra convenience options on their form:

Feed source	Option	What it does
CQG	Use demo credentials	Logs in with a CQG demo account instead of live
CQG	Connect on startup	Auto-connects this feed when DeepCharts opens
Rithmic	Include commissions	Shows commissions in P/L (on by default)
dxFeed	DOM Type	MBO or MBP depth data — MBP is much lighter on slow connections

Switch to a different feed

4. Click **Select Connection** and click the feed you want. Wait for its dot to turn green.
5. Open **Options** → **Symbol Manage** and re-point your exchanges to the feed you switched to (chain-link icon on each exchange row). Charts keep reading from whatever feed their exchange is routed to — if that feed is now disconnected, they show no data. Click the chain-link icon in the interactive mock below to see the feed cycle. See Symbol Manage: Subscribe Exchanges and Map Your Feed.

[WIDGET: symbol-manage-mock]

6. If a chart was already open, it may refresh on its own within a few seconds. If not, close it and reopen it so it loads from the newly routed feed.

Run several feeds at once

7. Connect each feed from **Select Connection** — you can hold multiple green connections simultaneously.
8. In **Symbol Manage**, route each exchange to the feed that should serve it. Typical combinations:
 - **Execution + data**: IBKR or a V-Sim contest account for orders, Rithmic/dxFeed for charts — route every exchange to the data feed (Connect Interactive Brokers (Execution Only), DeepCharts Competition: Join and Connect).
 - **Exchange split**: one feed for CME, another for COMEX — route each exchange to its own feed.

Warning: In any multi-feed setup, all involved feeds must be connected (green) before you open a chart. If only one is connected, charts on exchanges routed to the other feed show no data even though the routing is correct.

Auto-connect on startup

9. In **Feed Settings**, open your main connection and enable **Connect on startup** if the option is present, then click **Save**. DeepCharts will connect that feed automatically every time the app opens. This option has been confirmed on the CQG form; exact availability may vary by feed source. **[CONFIRM: which feed sources besides CQG offer Connect on startup]**

Remove a connection

10. In **Feed Settings**, select the connection and click **Remove**, then **Save**.

Warning: Removing a connection deletes its saved credentials from the form — you will need to re-enter them to recreate it. Also re-check **Symbol Manage** afterwards: exchanges that were routed to the removed feed need a new Data Feed assignment or their charts will stop loading.

If you also run DeepDom

DeepCharts and DeepDom share **one bridge**: a single data-feed connection serves both apps at the same time, but the bridge cannot hold two different configurations. Enter the feed settings **identically** in both apps. If you run both and one of them will not connect, first check that both apps' feed settings match exactly.

Verify it worked

- Every feed you intend to use shows a green dot in **Select Connection**.
- Each exchange in **Symbol Manage** points at a currently connected feed.
- Charts load and move on every exchange you trade.

If something went wrong

Symptom	What to do
Feed will not connect after switching	Credentials or server issue on that profile — see Fix: Connection Failed — Check Username and Password and Fix: Connection Failed — Unable to Establish Connection
Green dot but charts frozen after a switch	Exchange still routed to the old feed — see Fix: Live Feed Connected but Chart Is Not Moving
One app connects, the other does not (DeepDom setup)	Feed settings differ between the apps — make them identical
App crashes when saving a connection	See Fix: App Crashes When Saving Feed Settings
