

Move DeepCharts to a New Computer

Account & Billing | intermediate | 30 min to complete | DeepCharts Help Center | August 24, 2026

By the end you will have DeepCharts running on your new computer with your license activated, your data feed connected, and your saved workspaces and templates restored.

A migration has two halves: things that follow your account automatically (your license, cloud-saved workspaces and templates, your feed subscription) and things that live only on the old machine (locally saved workspaces and templates, feed credentials entered in the app, the Symbol Manage mapping, and the local market data database). The steps below make sure nothing from the second group gets left behind.

Before you start

- Your my.deepcharts.com login and license key at hand — see [How to Install DeepCharts and Activate Your License](#) for where the key lives
- Your data feed username and password — from the Subscriptions page on my.deepcharts.com, or from your broker or prop firm's welcome email ([How to Buy a Data Feed and Get Your Credentials](#))
- The new machine meets the System Requirements
- Both machines available for a short while, so you can copy anything the old one still holds
- Optional but recommended: read how [Local and Cloud storage differ in Templates and Workspaces](#)

Note: Your license allows installation on up to 5 devices, but the account can be active on one device at a time. **[CONFIRM: whether the old machine must be deactivated first, or whether activating the new machine is enough]**

Steps

Part 1: Back up on the old computer

1. Open DeepCharts on the old machine and save your current layout as a **Workspace**, choosing **Cloud** as the destination. Cloud saves are tied to your account and license, so they appear automatically on any machine running the same license — the easiest migration path. Do the same for any chart **Templates** you want to keep (right-click the chart → **Template** → **Save As** → **Cloud**). Full walkthrough: [Templates and Workspaces](#).

[SCREENSHOT PLACEHOLDER] Workspace save dialog with the Cloud destination selected and a workspace name entered, illustrating a cloud backup before migration [workspace-save-cloud-before-migration.png](#)

2. If you prefer file copies (or have no cloud saves), copy the **Template** and **Workspace** folders from **Documents** → **deepchart** on the old PC to a USB drive or cloud drive. These folders hold every locally saved template and workspace.

[SCREENSHOT PLACEHOLDER] Windows Explorer showing the Documents\deepchart folder with the Template and Workspace subfolders highlighted for copying [documents-deepchart-template-workspace-folders.png](#)

Warning: DeepCharts does not auto-save layouts. Anything you configured but never saved as a Workspace or Template exists nowhere and cannot be migrated — save it now, before touching the old installation.

3. Confirm you can retrieve your feed credentials. Feed usernames and passwords are never migrated with the app — you will re-enter them on the new machine. Website-bought feeds show them on the my.deepcharts.com **Subscriptions** page ([Manage Your Subscriptions and Billing](#)); broker and prop-firm credentials come from that provider.
4. Close DeepCharts on the old machine and leave it closed. Running the platform on both machines at the same time can cause license validation issues — see [Fix: License and Activation Issues](#).

Part 2: Set up the new computer

5. Log in to my.deepcharts.com on the new machine and download the latest installer. If your license came from a **prop firm**, download the installer and license details from the prop firm's dashboard instead.
6. Install and activate, following How to Install DeepCharts and Activate Your License: temporarily disable the antivirus during installation, run the installer, then activate with your registered email and license key (paste both with no leading or trailing spaces).

7. Reconnect your data feed. Open **Feed Settings**, create the connection for your provider and enter the username and password you collected in step 3 — credentials always have to be re-entered on a new installation. Try it in the Feed Settings window below: pick your source and watch the fields change per provider. Provider-specific steps: How to Connect a Data Feed (Feed Settings).

[WIDGET: feed-navigator]

Note: Your market data agreement is tied to your feed account, not to the computer — you do not need to sign it again for a machine change. If the connection is refused anyway, see Fix: Connection Failed — Check Username and Password.

8. Map your exchanges to the new connection in **Options** → **Symbol Manage**, the same way the first-run wizard did on the old machine — see Symbol Manage: Subscribe Exchanges and Map Your Feed. Practice the mapping in the mock below: click the chain link to cycle which feed an exchange is mapped to. If you load a Cloud workspace in the next step, check the mapping afterwards anyway: the feed connection itself is part of the new install, not of the workspace.

[WIDGET: symbol-manage-mock]

9. Restore your layout: open the **Workspace** selector, choose the load option and pick your workspace from the **Cloud** tab. If you backed up files instead, copy them into **Documents** → **deepchart** → **Workspace** and **Template** on the new PC first, then load from the **Local** tab.

If you want to move your market data database (optional)

Historical chart data is stored in a local database and re-downloads automatically on the new machine as you open charts, so most users skip this. If you have a large database you would rather not re-download, the database location is configurable under **Options** → **Settings** → **General**, in the **Various** section (**Database folder**). You can copy the old machine's database folder to the new one and point this setting at it. Exact behavior when swapping database folders between installations may vary — if the copied database misbehaves, clear it and let the platform re-download (Re-download Historical Data (Download Data Tool)).

[SCREENSHOT PLACEHOLDER] Options → Settings → General with the Various section visible and the Database folder location setting highlighted `database-folder-setting-migration.png`

Verify it worked

- DeepCharts starts on the new machine without asking for the license again.
- The **Feed** selector shows your connection with a green dot.
- Loading your workspace restores every chart and window, and charts fill with data (fresh history may take a moment to download — progress is visible under **Options** → **Show Log** → **Connection Logs**).

If something went wrong

Symptom	What to do
"Invalid License" on the new machine	Re-paste email and key without spaces; close DeepCharts on the old PC; see Fix: License and Activation Issues
Feed connection stays red	Fix: Connection Failed — Check Username and Password, then Fix: Connection Failed — Unable to Establish Connection
Cloud tab shows no workspaces	They were saved locally on the old PC — copy the Documents → deepchart folders across, see Templates and Workspaces
Charts open but stay empty	Check the Symbol Manage mapping (Symbol Manage: Subscribe Exchanges and Map Your Feed), then Fix: Live Feed Connected but Chart Is Not Moving
Historical data missing or patchy	Let it re-download, or force it with Re-download Historical Data (Download Data Tool)
