

Volume Profile

Indicators | intermediate | 7 min read | DeepDOM Help Center | August 24, 2026

The Deep Profile displays the volume traded at each price level over a specific period. It gives you a clear visual map of where most market activity has taken place, helping you identify key structural levels including:

POC (Point of Control) — the price level with the highest traded volume

Value Area — the price range where a defined percentage of total volume occurred

High Volume Nodes (HVN) — price levels with heavy activity, often acting as support or resistance

Low Volume Nodes (LVN) — price levels with little activity, often allowing fast price movement through them

How to Add the Volume Profile to Your Chart

Right-click on the chart and select Indicators.

Search for the desired indicator and add it to your workspace by clicking the "+" button.

Open the indicator's settings panel, customize the parameters according to your preferences, and confirm the changes by clicking Save.

General Settings

Vbp Type Select what data the profile displays:

Volume — shows total volume traded at each price level, highlighting the most active areas

Ask/Bid Volume — splits the volume into Ask (sell) and Bid (buy) separately, showing the balance between buyers and sellers

Delta — shows the difference between buy and sell volume at each level, useful for identifying market pressure

Total Delta and Volume — combines both delta and total volume for a complete view of activity at each price level

Grouping Defines how price levels are grouped together in the profile:

Automatic — DeepDOM automatically groups ticks based on market characteristics and chart resolution

Manual — lets you specify a custom number of ticks for grouping

Auto Group Factor When using Automatic grouping, this defines how aggressively ticks are aggregated. A higher value means greater aggregation and a broader profile.

Manual Ticks When using Manual grouping, this sets the exact number of ticks to group together, giving you precise control over the granularity of the profile

Plot Settings

Method Color — Defines how the profile bars are colored:

None — no color applied, plain data display

Fixed — a single uniform color applied to all price levels

Fading — color intensity varies with volume; higher volume levels appear more intense, lower volume levels appear lighter

More Colors — uses a range of colors to represent different volume levels, fully customizable by the user

Color Calculation — Defines what the color represents:

Volume — colors based on total volume

Delta — colors based on the difference between buy and sell orders

Imbalance — colors based on order imbalance

Color Lets you set fixed colors for Volume, Bid, Ask, and the profile line.

Range Defines the range used for color scaling:

Automatic — uses platform default ranges

User — lets you define custom value ranges

[SCREENSHOT PLACEHOLDER] Volume Profile — Plot Settings (DeepDOM)

dd-en-volume-profile-deepdom-04.png

Show Text When enabled, displays the total volume traded at each tick or price level directly on the profile bars.

Text Settings Lets you customize the color of the Bid, Ask, and Total Volume labels, as well as the font size

dd-en-volume-profile-deepdom-05.png

POC (Point of Control)

The POC is the price level with the highest traded volume in the profile. It is one of the most important reference levels in volume analysis.

Enable — show or hide the POC on the chart

Highlight — visually emphasize the POC bar within the profile to make it stand out

Highlight Color — set the color used for the POC highlight

Show Line — draw a horizontal line extending from the POC across the chart

Line Color — set the color of the POC line

Line Width — set the thickness of the POC line

dd-en-volume-profile-deepdom-06.png

Value Area

The Value Area is the price range within which a defined percentage of total volume occurred. It represents the zone of greatest market acceptance.

Enable — show or hide the Value Area on the chart

% Value Area — set the percentage of total volume used to define the Value Area. The default is typically 70%, meaning the range within which 70% of all volume occurred

Highlight — visually highlight the Value Area on the candles

Outside Color — set the color applied to the area outside the Value Area, helping to distinguish it clearly

Show Line — draw lines marking the Value Area High (VAH) and Value Area Low (VAL)

Line Color — set the color of the Value Area boundary lines

Line Width — set the thickness of the Value Area boundary lines

[SCREENSHOT PLACEHOLDER] Volume Profile — Value Area (DeepDOM)

dd-en-volume-profile-deepdom-07.png

Peaks and Valleys

Peaks and Valleys highlight areas of high and low volume concentration within the profile:

Peaks — price levels where volume is heavily concentrated, often indicating strong market interest and potential support or resistance

Valleys — price levels where volume is very thin, often acting as void zones where price can move quickly

Sensitivity Controls how strictly peaks and valleys are identified. A higher value means fewer but more significant peaks and valleys. A lower value shows more levels with a looser filter.

Peak Settings

Highlight — visually mark peak levels on the profile

Minimum Volume — set a minimum volume threshold; peaks below this value will not be shown

Highlight Color — set the color for peak highlights

Show Line — draw a horizontal line at each peak level

Line Width — set the thickness of the peak line

Line Color — set the color of the peak line

Valley Settings

Highlight — visually mark valley levels on the profile

Minimum Volume — set a minimum volume threshold; valleys below this value will not be shown

Highlight Color — set the color for valley highlights

Show Line — draw a horizontal line at each valley level

Line Width — set the thickness of the valley line

Line Color — set the color of the valley line

Summary

The Summary displays a detailed data panel for each volume profile on the chart, including total volume, delta, number of trades, number of ticks, and other statistics. This makes it easy to compare activity across different sessions or time periods at a glance.

Enable Summary — show or hide the summary panel for each profile

Text Color — set the color of the summary text

Ask Color — set the color representing Ask volume in the summary

Bid Color — set the color representing Bid volume in the summary

[SCREENSHOT PLACEHOLDER] Volume Profile — Summary (DeepDOM)

dd-en-volume-profile-deepdom-09.png

Labels on Line

Text Color — edit the color of the lines

Text on Line — enables labels on lines derived from the Volume Profile, such as the VPOC and Value Area High/Low labels

[SCREENSHOT PLACEHOLDER] Volume Profile — Labels on Line (DeepDOM)

dd-en-volume-profile-deepdom-10.png

Conclusion

The Deep Profile indicator is one of the most comprehensive tools available in DeepDom for understanding market structure. By identifying where volume has concentrated and where it is absent, you gain a significant edge in locating meaningful support and resistance levels, planning entries, and understanding the overall context of price action.
