

# Fix: Connection Lost When Opening a Chart

Connections & Data Feeds / Troubleshooting | beginner | 10 min to complete | DeepCharts Help Center | August 24, 2026

Your data feed connects without any problem — but the moment you open a chart, the connection drops and DeepCharts shows warnings or error messages. This guide covers the two known causes: an unstable internet connection and Windows language or region settings that break chart data parsing.

## Symptom

- The data feed connects successfully and the connection indicator looks normal.
- As soon as you open a chart — specifically when the chart data starts loading — the connection drops and one or more warnings or error messages appear.

[ SCREENSHOT PLACEHOLDER ] DeepCharts main window at the moment the connection drops after opening a chart, with the disconnect warning or error message visible on screen dc-en-connection-lost-opening-chart-01.png

Not to be confused with:

- Fix: Connection Failed — Unable to Establish Connection — the feed never connects in the first place.
- Fix: Live Feed Connected but Chart Is Not Moving — the feed stays connected but the chart does not update.

## Most likely cause

A brief network interruption while the chart downloads its data — or, if it happens every single time, Windows language and region settings that are not English (US), which change how dates, numbers and decimals are formatted and cause parsing errors during chart data loading.

## Quick fix

Refresh your internet connection first — it is the fastest cause to rule out:

1. Disconnect from your current network.
2. Reconnect to the internet. A stable wired connection is preferable to Wi-Fi.
3. Restart DeepCharts.
4. Connect your data feed and open the chart again.

If the connection still drops when the chart loads, continue below.

## If that didn't work

### ***Cause: Windows language or region is not English (US)***

The data feed and charting components require an English display language and US or English-based region formats. Other regional formats can cause parsing errors exactly at the point where chart data starts loading — which is why the feed connects fine but drops on chart open.

1. Open **Windows Settings** → **Time & Language** → **Language** and set the Windows display language to **English**.

[ SCREENSHOT PLACEHOLDER ] Windows Settings, Time & Language, Language page with the Windows display language dropdown open and English selected dc-en-connection-lost-opening-chart-02.png

2. Open **Windows Settings** → **Time & Language** → **Region** and set **Country or region** to **United States** (or another English-supported region).

3. Restart your computer.
4. Launch DeepCharts, connect the data feed and open the chart again.

**Note:** The restart in step 3 is mandatory — Windows only applies regional format changes system-wide after a reboot. Changing the setting without restarting will not fix the issue.

## Still stuck

Generate a Diagnostic Report: Before You Contact Support so support can see your system and connection details, then contact us through [How to Get Help \(Chat, Diagnostic Report, Support\)](#).

## Prevent this

- Keep Windows set to English with US or English-based regional formats.
- Make sure your internet connection is stable before opening charts — ideally wired.
- Follow [How to Connect a Data Feed \(Feed Settings\)](#) when setting up a feed so the connection is configured correctly from the start.
