

Aroon Up/Down

Indicators & Analysis / Trend | intermediate | 4 min read | DeepCharts Help Center | August 24, 2026

The Aroon Up/Down indicator evaluates trend momentum by measuring how recently price made a new high or a new low within a selected period. Instead of asking "how far has price moved?", Aroon asks "how fresh is the latest extreme?" — a subtly different and often earlier read on trend health.

The indicator plots two lines in their own panel, each ranging from 0 to 100, so you always see the bullish and bearish sides of the market measured separately.

What it is

Aroon consists of two components:

- **Aroon Up** — measures the strength of bullish momentum: it is high when a new period-high was made recently and decays as that high ages.
- **Aroon Down** — measures the strength of bearish momentum in the same way, based on the most recent period-low.

A reading near 100 means the corresponding extreme was set very recently; a reading near 0 means it happened long ago within the lookback window. Because the two lines are independent, Aroon distinguishes "strong uptrend" (Up high, Down low) from "volatile chop" (both elevated) in a way single-line tools cannot.

When to use it

- To spot emerging trends early: a line pinned near 100 means price keeps printing fresh extremes in that direction.
- To time trend changes with **Aroon Up/Aroon Down crossovers**.
- To confirm consolidation: both lines drifting low means no new highs or lows are being made — a range.
- As a complement to ADX: ADX measures trend strength without direction; Aroon shows which side is producing the fresh extremes.

Quick start

1. Open a chart and click the bar-chart icon in the top-left corner to open the **Indicators** panel.
2. Click **Indicators** to open the full **Indicator List**.
3. Search for "Aroon Up/Down" and click **+** to add it — it plots in its own panel below the price chart.
4. Click the gear icon next to the indicator to open its settings.

The default **Length** of 14 with the standard levels (75 / 50 / 25) is a solid starting point. Give Aroon Up and Aroon Down strongly contrasting colors — the crossovers are the signal, so they need to be visible at a glance.

How to read it

- **Aroon Up near 100, Aroon Down near 0**: strong uptrend — new highs keep arriving while the last low ages. Reverse the reading for a downtrend.
- **Crossovers**: Aroon Up crossing above Aroon Down suggests bullish momentum taking control; the opposite cross suggests bearish control. Crosses that happen near the **Middle Level** (50) with both lines moving decisively are cleaner than crosses in the low zone.

- **Above the High Level (75):** strong trend momentum on that side.
- **Below the Lower Level (25):** weak momentum — that side of the market has not set an extreme in a long time.
- **Both lines low:** consolidation. Neither side is making progress, so trend signals are unreliable until one line breaks upward.

Settings reference

Parameters

Setting	What it does
Length	Number of bars used in the calculation. Default: 14. Lower values produce faster-responding signals; higher values deliver smoother trend analysis.

Level settings

Setting	What it does
Middle Level	The equilibrium line between bullish and bearish forces. Default: 50.
Lower Level	The threshold that signals weak trend momentum. Default: 25.
High Level	The threshold that signals strong trend momentum. Default: 75.
Level colors / Level Width	The color of each level line and the line thickness are customizable.

Subgraphs (Aroon Up and Aroon Down)

Both lines offer identical configuration:

Setting	What it does
Color	Line color for the subgraph.
Line Style	Visual pattern. Default: Solid .
Line Width	Line thickness.
Short Name	Custom label shown in the chart legend.
Name Label / Value Label	Optional labels showing the line's name and current value, with configurable background colors.
Include on Auto Center	Whether this line is considered when the panel auto-scales.

Tips and common mistakes

- **Do not trade every crossover.** In a range the lines cross constantly; require one line to push toward the High Level after the cross before treating it as a trend signal.
- **Aroon measures recency, not magnitude.** A new high by one tick resets Aroon Up to the top exactly like a major breakout does. Check price structure or volume before assuming strength.
- **Length defines what counts as "recent".** A 14-bar Aroon on a 5-minute chart describes roughly the last hour of extremes; the same setting on a daily chart describes three weeks. Set it to the horizon you actually trade.

- If you prefer the same information compressed into a single line around zero, use the Aroon Oscillator instead.
