

Volume

Indicators | intermediate | 2 min read | DeepDOM Help Center | August 24, 2026

The Volume indicator displays total traded volume and can color the background according to delta, helping you quickly see where participation increases and which side is more aggressive.

Apply the Volume Indicator

[SCREENSHOT PLACEHOLDER] Volume — Apply the Volume Indicator (DeepDOM) volume-deepdom-01.png

To add the Volume indicator to a chart:

Enable Volume directly from the toolbar button at the top of the chart.

Open the settings by clicking the indicator's settings icon.

General Settings

[SCREENSHOT PLACEHOLDER] Volume — General Settings (DeepDOM) volume-deepdom-02.png

Sets the number of bars used to group the indicator. Lower values give more detailed, bar-by-bar volume; higher values create smoother blocks of volume.

Display mode

Controls how the background is colored:

Dominant — colors the background with a delta gradient emphasizing which side (Bid or Ask) is dominant

[SCREENSHOT PLACEHOLDER] Volume — Display mode (DeepDOM) volume-deepdom-03.png

Split — shows separate Bid and Ask volumes, allowing you to compare buying and selling activity directly

Interpreting Volume Behaviour

1. Volume Spikes

Very high volume relative to the surrounding bars often marks key events: news, stop-runs, or institutional repositioning. When accompanied by strong directional price movement, it can confirm trend acceleration; when price fails to extend, it may represent exhaustion.

2. Low Volume Pullbacks

In trends, pullbacks that occur on low volume suggest a corrective move rather than a true reversal. Many traders look for continuation signals as volume returns in the direction of the prevailing trend.

3. Volume in Ranges

Inside well-defined ranges, monitor where volume concentrates:

High volume near range extremes often coincides with position-building and absorption.

High volume in the middle suggests balance; breaks from such balance areas often start new swings.

Combining Volume with Order Flow Tools

With Delta Bar / CVD: use Volume to identify where participation was large, then study whether the aggression came from buyers or sellers.

With Big Trades: high Volume bars that also contain Big Trades markers show not only that the bar had activity, but that large players were involved.

With Important Levels: high Volume around session highs/lows or open provides evidence that these levels matter to the market.
