

# Deep V-Tracker

Indicators & Analysis / Deep Indicators | advanced | 5 min read | DeepCharts Help Center | August 24, 2026

Deep V-Tracker is a sophisticated Order Flow indicator that detects volumetric imbalances and specific price patterns. It combines two independent modules: **Patterns**, which flags anomalies in trading speed and candlestick behavior, and **Absorption & Pressure**, which draws horizontal levels where buyers or sellers are exerting real force.

Together they answer two different questions — "is something unusual happening inside this candle?" and "at which prices are large participants pressing or absorbing?"

## What it is

The Patterns module watches how each candle forms and marks three anomalies: sudden acceleration in orderflow, deceleration (slowdown), and exhaustion of the aggressive side. The Absorption & Pressure module maps horizontal force levels, labeled by type (Pressure, Absorption, Control and Extreme variants), colored by which side is acting. Both modules aim at the same goal: exposing institutional activity and high-probability trade levels.

## When to use it

- You want automatic detection of orderflow "jerks" (acceleration) at rejection points and trend-continuation zones.
- You look for exhaustion at extremes — buyers finishing in an uptrend, sellers finishing in a downtrend.
- You want a live map of pressure and absorption levels with clear key-level and invalidation labels.
- You prefer configurable noise filtering (Strong/Medium/Weak) over an all-or-nothing signal tool.

## Quick start

1. Open the **Indicator List** on your chart, find **Deep V-Tracker** and click +.
2. Click the **Settings** icon to configure the modules.
3. In the Patterns module, enable only **Acceleration** to start — the team recommends disabling the other patterns at first to reduce clutter — and set **Pattern Mode** to **Strong**.
4. In the Absorption & Pressure module, start with **Intensity = Strong** and **Level Mode = Conservative** so only the most structural levels are drawn.
5. Optionally create alerts under **Options** → **Settings** → **Add Alert**; the alert then appears in the Deep V-Tracker list.

## How to read it

### *Patterns module*

| Pattern             | Meaning                                                                                                                                                                                                |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Acceleration</b> | A sudden "jerk" in orderflow during candle formation, drawn as a filled cyan box over the candle body. Signals zones of strong institutional interest — rejection points and trend-continuation areas. |
| <b>Slowdown</b>     | Price movement decelerating in the current direction — potential consolidation or a weakening trend.                                                                                                   |
| <b>Exhaustion</b>   | The aggressive side has depleted its orders. In an uptrend: buyers are done, reversal risk. In a downtrend: sellers are done, a bottom may form.                                                       |

### ***Absorption & Pressure module***

Color tells you which side is acting: **purple = bid activity (seller pressure)**, **green = ask activity (buyer pressure)**.

| Label             | Meaning                                                          |
|-------------------|------------------------------------------------------------------|
| <b>P</b> (dashed) | Strong buying pressure.                                          |
| <b>P</b> (solid)  | Strong selling pressure.                                         |
| <b>A</b>          | Absorption — aggressive orders blocked by passive orders.        |
| <b>PC</b>         | Pressure Control — key selling level.                            |
| <b>PE</b>         | Pressure Extreme — invalidation level for the pressure zone.     |
| <b>AC</b>         | Absorption Control — key buying level.                           |
| <b>AE</b>         | Absorption Extreme — invalidation level for the absorption zone. |

Read Control levels (**PC**, **AC**) as the key prices to trade around, and Extreme levels (**PE**, **AE**) as the "I'm wrong" lines: if price trades through an Extreme, the corresponding zone is invalidated.

## **Settings reference**

Grouped by module as in the settings dialog.

### ***Patterns module***

| Setting                    | What it does                                                                                                                                          |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Pattern toggles</b>     | Enable/disable <b>Acceleration</b> , <b>Slowdown</b> , <b>Exhaustion</b> individually.                                                                |
| <b>Pattern Mode</b>        | Noise filter: <b>Strong</b> shows only strong levels with minimal noise, <b>Medium</b> is balanced, <b>Weak</b> shows more markers with higher noise. |
| <b>Color</b> (per pattern) | Custom color for each pattern type.                                                                                                                   |

### ***Absorption & Pressure module***

| Setting                           | What it does                                                                                                                                               |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Intensity</b>                  | <b>Strong</b> draws only the strongest levels (minimal noise), <b>Medium</b> balances visibility and noise, <b>Weak</b> draws more levels with more noise. |
| <b>Level Mode</b>                 | <b>Conservative</b> favors solid structural zones, <b>Medium</b> is balanced, <b>Aggressive</b> draws levels close to price that are easier to violate.    |
| <b>Control/Extreme Line Width</b> | Line thickness for Control and Extreme levels.                                                                                                             |
| <b>Bid Color / Ask Color</b>      | Colors for the purple bid-side and green ask-side levels.                                                                                                  |

| Setting                 | What it does                                    |
|-------------------------|-------------------------------------------------|
| <b>Text Size</b>        | Size of the P/A/PC/PE/AC/AE labels.             |
| <b>Number of Bars</b>   | How far the lines extend (line length in bars). |
| <b>Extend Far Right</b> | Extends levels all the way to the price scale.  |

## Alerts

| Setting          | What it does                                                                                                                                                            |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Add Alert</b> | Create alerts via <b>Options</b> → <b>Settings</b> → <b>Add Alert</b> for any pattern, pressure or absorption event; the alert then appears in the Deep V-Tracker list. |

## Tips and common mistakes

- **Chart too crowded?** Enable only the Acceleration pattern, raise **Pattern Mode** to **Strong**, and set **Intensity = Strong** with **Level Mode = Conservative**. Add detail back only when the chart stays readable.
- **Do not confuse label color and pattern color.** Purple/green encodes which side acts on the levels; the cyan box is specifically the Acceleration pattern.
- **Respect the Extremes.** PE and AE are invalidation prices — holding a trade through them means trading against the tool's own logic.
- **Aggressive Level Mode is for scalping.** Levels near price get violated more often; use Conservative mode for swing-style structure.
- **Cross-check exhaustion.** An Exhaustion mark pairs well with the ratio and COT columns in Deep Stats before you fade a move.
