

How to Connect a dxFeed Data Feed

Connections & Data Feeds / Setup | beginner | 10 min to complete | DeepCharts Help Center | July 15, 2026

By the end you will have your dxFeed account connected with a green dot and a chart loading live dxFeed data. This guide covers dxFeed subscriptions bought from the DeepCharts website (the most common case) and directly from dxfeed.com. If your dxFeed account comes from a prop firm (MFF, Aqua, Goat and similar), follow Connect a Prop-Firm dxFeed Account (MFF, Aqua, Goat...) instead — prop accounts use a different Feed Source and have no Server field.

Before you start

- A dxFeed subscription — bought on the DeepCharts website (How to Buy a Data Feed and Get Your Credentials) or on dxfeed.com with DeepCharts selected as the platform.
- The market data agreement signed — see Sign Your Market Data Agreement. For website purchases your credentials stay hidden in the dashboard until you sign; after signing, the username and password become visible on the Subscriptions page. Record them.
- DeepCharts installed and running — see How to Install DeepCharts and Activate Your License.

Steps

1. In DeepCharts, click **Select Connection** in the main toolbar, then click **Feed Settings** at the bottom of the dropdown.

[SCREENSHOT PLACEHOLDER] Main toolbar with the Select Connection dropdown open and Feed Settings highlighted at the bottom dxfeed-open-feed-settings.png

2. In the Feed Settings window, click **Add Connection**.
3. Fill in the connection fields:

Field	Value
Name	Any name for this profile, for example "My dxFeed"
Feed Source	dxFeed
Username	The dxFeed username from your dashboard
Password	The dxFeed password from your dashboard
Server	Website Account if bought on the DeepCharts website; dxFeed Account if bought on dxfeed.com
DOM Type	MBO or MBP — see below

[SCREENSHOT PLACEHOLDER] Add Connection form with Feed Source set to dxFeed, Server set to Website Account and the DOM Type field visible with MBO selected dxfeed-connection-form-website-account.png

Note: DOM Type controls the Level 2 depth format. dxFeed's CME Group Level 2 data is MBO (market-by-order) — pick **MBO** for full per-order depth, which is best for the DOM and orderflow indicators. **MBP** is much lighter data; choose it if your connection is slow or charts lag during high-volume periods.

4. Click **Save** and close the window.
5. Click **Select Connection** again and click your new dxFeed profile to connect. The circle next to it should turn green within about 10 seconds.

[SCREENSHOT PLACEHOLDER] Select Connection dropdown with the dxFeed profile connected and its status circle green dxfeed-connected-green.png

6. Disconnect the feed (click it again), then open **Options** → **Symbol Manage** and route your exchanges to this feed — the full walkthrough is in Symbol Manage: Subscribe Exchanges and Map Your Feed. In

short: if your exchange is listed, make sure its **Data Feed** column points at the dxFeed profile (chain-link icon to change it); if it is not listed, click **Subscribe**, find the exchange and assign the dxFeed profile.

7. Close Symbol Manage and reconnect. Confirm the circle is green again.

8. Open a chart: **New** → **Price Chart**, select an instrument (for example ES or NQ) and open it.

If you also run DeepDom

DeepCharts and DeepDom share one data bridge — the same dxFeed connection serves both applications at the same time, but the settings must match exactly. In DeepDom's feed settings enter the identical dxFeed credentials, the same Server value (**Website Account**) and the same **DOM Type**, then connect. If one application will not connect while the other works, mismatched feed settings between the two are the first thing to check.

Verify it worked

- The connection circle in **Select Connection** is green.
- A chart on a subscribed exchange draws candles and the price updates live.

Note: dxFeed runs two servers — Frankfurt (EU) and Virginia (US) — and routes you automatically to the nearest one; there is no server-region choice to make. If you see data delay, what matters is your download speed from that server's region, and switching **DOM Type** to MBP is the usual fix on a slow line.

If something went wrong

Symptom	See
Circle stays red — credentials rejected	Fix: Connection Failed — Check Username and Password — make sure you are using the dashboard-issued feed credentials and that the agreement is signed
Error "Unable to load DLL DXFeed_64.dll"	Fix: Unable to Load DLL DXFeed_64.dll
Error DATA_ACCESS_SUSPENDED	Fix: dxFeed DATA_ACCESS_SUSPENDED
Green circle but charts not moving	Fix: Live Feed Connected but Chart Is Not Moving
Charts lag during busy periods	Fix: Charts Lagging or Data Delayed (Checklist) — and consider DOM Type = MBP

Warning: dxFeed credentials issued through other charting platforms (Quantower, Sierra Chart, ATAS and similar) cannot be used with DeepCharts, and dxfeed.com purchases only work when DeepCharts was selected as the platform at checkout. If you picked another platform, contact dxFeed support to re-issue credentials for DeepCharts.
