

# Welcome to DeepCharts: Platform Tour

Getting Started | beginner | 6 min read | DeepCharts Help Center | July 20, 2026

---

DeepCharts is a Windows platform for orderflow analysis and trading. Instead of one fixed screen, it gives you a small control bar — the main bar — from which you open exactly the windows you need: price charts, DOMs, tape readers, profile charts, scanners and trading tools.

This tour walks the main bar menu by menu, explains what each window type is for, and points you to the right article for each next step. You do not need to memorize anything here — the goal is that when you see a menu label later, you already know what lives behind it.

## The idea in one paragraph

Think of a professional trading desk: one trader might keep a price chart on the left monitor, a depth-of-market ladder in the middle and a time-and-sales tape on the right — each screen doing one job well. DeepCharts works the same way. The platform itself is a thin coordinator (the main bar); everything else is a specialized window you open, arrange and save as a workspace. Market data flows in from a data feed you connect (live or free delayed), and every window reads from that same feed.

## Why traders care

- **You build your own screen.** Nothing is forced on you — a scalper's workspace and a swing trader's workspace can look completely different in the same platform.
- **Orderflow first.** Beyond classic candlestick charts, DeepCharts ships footprint, volume profile, DOM and tape tools designed around who is buying and who is selling — see Orderflow 101: Bid, Ask, Aggressor and Delta for the concepts.
- **One feed, many views.** Connect a data feed once and every chart, DOM and scanner uses it. The free delayed feed means you can explore everything before paying for data — see Use the Free 15-Minute Delayed Data Feed.
- **Layouts persist.** Window arrangements are saved as workspaces, so tomorrow's session starts where today's ended — see Templates and Workspaces.

## How it works

Everything starts from the main bar — the slim bar at the top of your screen after the app launches. Below is a **working mock of it**: click every menu, hover the items, and click any item to jump straight to its guide.

[WIDGET: main-bar]

### *The main bar*

From left to right the main bar contains the menus — **New, Options, Trading, Window, About us** and a ? help menu — plus two controls you will use constantly:

- **Workspace** selector — create, save and open window layouts (**New, Save as, Open**; layouts can be stored locally, in the cloud, or shared).
- **Feed** selector — shows your active data connection with a colored status dot. Green means connected; when nothing is connected it reads **Select a connection**. The dropdown lists your saved connections plus a **Feed Settings** entry for adding new ones — try it in the mock above: click ● **dxFeed - 15m** on the right end of the bar.

### *The New menu — opening windows*

**New** is where every analysis window is born:

| Menu item                                              | What it opens                                                                         |
|--------------------------------------------------------|---------------------------------------------------------------------------------------|
| <b>Price Chart</b>                                     | The standard chart window — candles, indicators, drawing tools. See The Chart Window. |
| <b>Book → Adv. Dom / Horizontal dom / Vertical dom</b> | Depth-of-market ladders in three layouts. See Advanced DOM Window.                    |
| <b>Adv. Time And Sales</b>                             | The tape — every executed trade as it prints. See Advanced Time And Sales (The Tape). |
| <b>Profile Chart</b>                                   | TPO and volume profile analysis. See Profile Chart Window (TPO and Volume Profiles).  |
| <b>Scanner</b>                                         | Scan the market for conditions you define. See Market Scanner.                        |
| <b>Correlation Viewer</b>                              | Compare how instruments move together. See Correlation Viewer.                        |

**Tip:** Open the **New** menu in the live mock at the top of this page — every entry there links to its window's full guide.

### *The Options menu — configuration and data*

**Options** holds platform configuration and data management: **Symbol Manage** (map exchanges to your data feed — the single most important setup window, see Symbol Manage: Subscribe Exchanges and Map Your Feed), **Settings** (language, theme, timezone, sounds, shortcuts — see Customize Language, Theme and Notification Sounds and How to Configure Keyboard Shortcuts), **Replay Tick Data** (practice on recorded markets, see Replay Market Data), **Symbols Rollover** (see Symbol Rollover (Change Contract Month)), a **Database** submenu (see Database Optimization), **Show Log**, **Show Calendar** (economic calendar) and a **Tool** submenu.

### *The Trading menu — orders and accounts*

The **Trading** menu is home to your execution tooling, including the **Orders** window listing every order you have placed (Orders Window), **Portfolio** with account balances, P/L and the built-in risk manager (Portfolio (Wallet), Risk Manager), **Signal Performance** for statistics on your past trades (Performance Analysis (Signal Performance)) and the **Trade Copier** for mirroring orders across accounts (How to Set Up the Trade Copier). Actual order entry happens on the chart itself through the trading panel — see Trading from the Chart.

### *The Window menu*

**Window** manages open windows, including **Position windows** — a dialog that arranges your window types across monitors, useful on multi-screen setups. See Arrange Windows Across Monitors (and Recover Off-Screen Windows).

### *About us and help*

**About us** contains **Calendar events** (the **Deepchart Events** window — join live sessions or watch recordings from inside the app), **Info** and **Website**. The **?** menu has two entries: **Guides**, which opens this help center in your browser, and **Contact Support**, which opens the diagnostic window — see How to Get Help (Chat, Diagnostic Report, Support) and Diagnostic Report: Before You Contact Support.

## See it in DeepCharts

Every window type from the tour has its own reference article:

- Charts: The Chart Window, Price Chart Settings, Drawing Tools and Annotations
- Orderflow windows: Advanced DOM Window, Advanced Time And Sales (The Tape), Profile Chart Window (TPO and Volume Profiles)
- Analysis: Market Scanner, Correlation Viewer

- Trading: Trading from the Chart, Orders Window, Portfolio (Wallet), Risk Manager

## Worked example

A typical first hour with DeepCharts looks like this. You install the platform and activate your license (How to Install DeepCharts and Activate Your License). On first launch a three-step startup wizard runs: you pick the free 15-minute delayed data feed (Use the Free 15-Minute Delayed Data Feed), confirm the exchange mapping in the embedded Symbol Manage step, and choose a theme and alert sound profile. The Feed selector dot turns green. You open **New** → **Price Chart**, pick an instrument, and candles start drawing (Open Your First Chart). From there you add an indicator, open a DOM next to the chart, and save the layout as your first workspace. Total cost so far: nothing — the delayed feed is free.

## Common misreadings

- **"DeepCharts comes with live market data."** It does not — the platform connects to a data feed you bring (or the free delayed one). Charts stay empty until a feed is connected and exchanges are mapped in Symbol Manage: Subscribe Exchanges and Map Your Feed.
- **"DeepCharts is a broker."** No. It connects to brokers, prop firms and data feeds — see Supported Brokers, Prop Firms and Data Feeds. You can also paper-trade on a built-in SIM account with no broker at all (Trading Accounts and Simulation).
- **"My symbol is missing, the feed must be broken."** Usually the exchange is simply not subscribed in **Options** → **Symbol Manage** — the instrument picker only lists subscribed exchanges.
- **"I skipped the wizard, so I have to reinstall."** Everything the wizard does can be redone later through **Feed Settings**, **Options** → **Symbol Manage** and **Options** → **Settings**.

## Go deeper

Follow the Getting Started path in order: System Requirements → How to Install DeepCharts and Activate Your License → Use the Free 15-Minute Delayed Data Feed → Open Your First Chart → Trading Accounts and Simulation — or take the single capstone walkthrough Quick Start: From Install to Your First Trade that chains them all into one session. When you are ready for live data, start at How to Buy a Data Feed and Get Your Credentials.
